

Warning buying a used PC or updating to win 11

Main problem for you is, if you have an older CPU???

How to find this out is easy.

1: in the bottom left corner look for (type here to search) type SYS. You should see an App stating (System information) just click on that. A full list should be shown.

2: Now go down the page untill you see (Processor) Intel(R)) Core TM **i7-6700** what you are looking for is the first set on numbers something like above = i3 i5-or i7-6700. . now look at the first number after the – symbol like above is **-6, this is your CPU generation is a 6.** they start from 1 through to 11 at this stage

3: Now windows 11 is designed to run on all generation 8 an above but not below

4: So here is my second point if you are looking to purchase a used PC make sure you check the CPU generation out first, as you will be throwing money down the drain if you wish to uses win 11

Hope this helps
